# Simulations vs. measurements of supercooled clouds

Bjørn Egil Kringlebotn Nygaard  
Winterwind 2011

# In-cloud icing

Figure 6. Growth of rime ice (dry growth).

## Recipe:

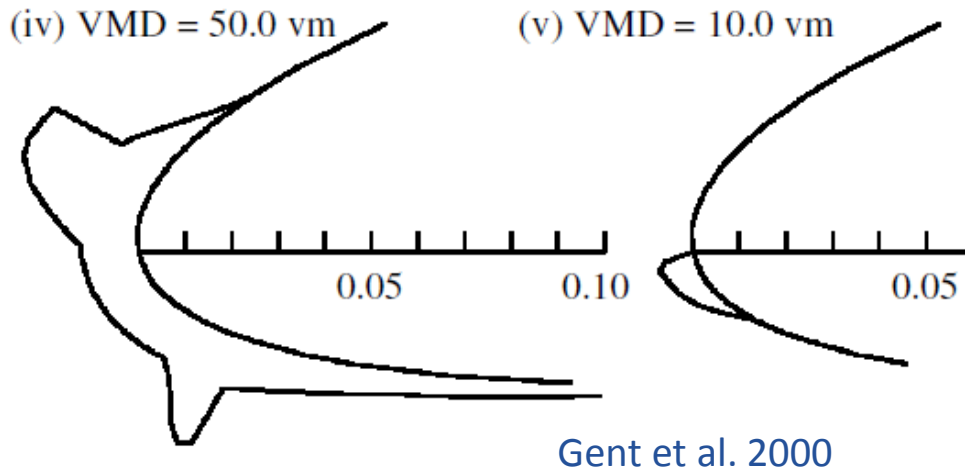

- Temperature below freezing point
- Liquid cloud droplets
- Wind

## Icing intensity:

- Wind speed
- Liquid Water Content (LWC)
- Droplet size (MVD)
- Object size/geometry

# Motivation

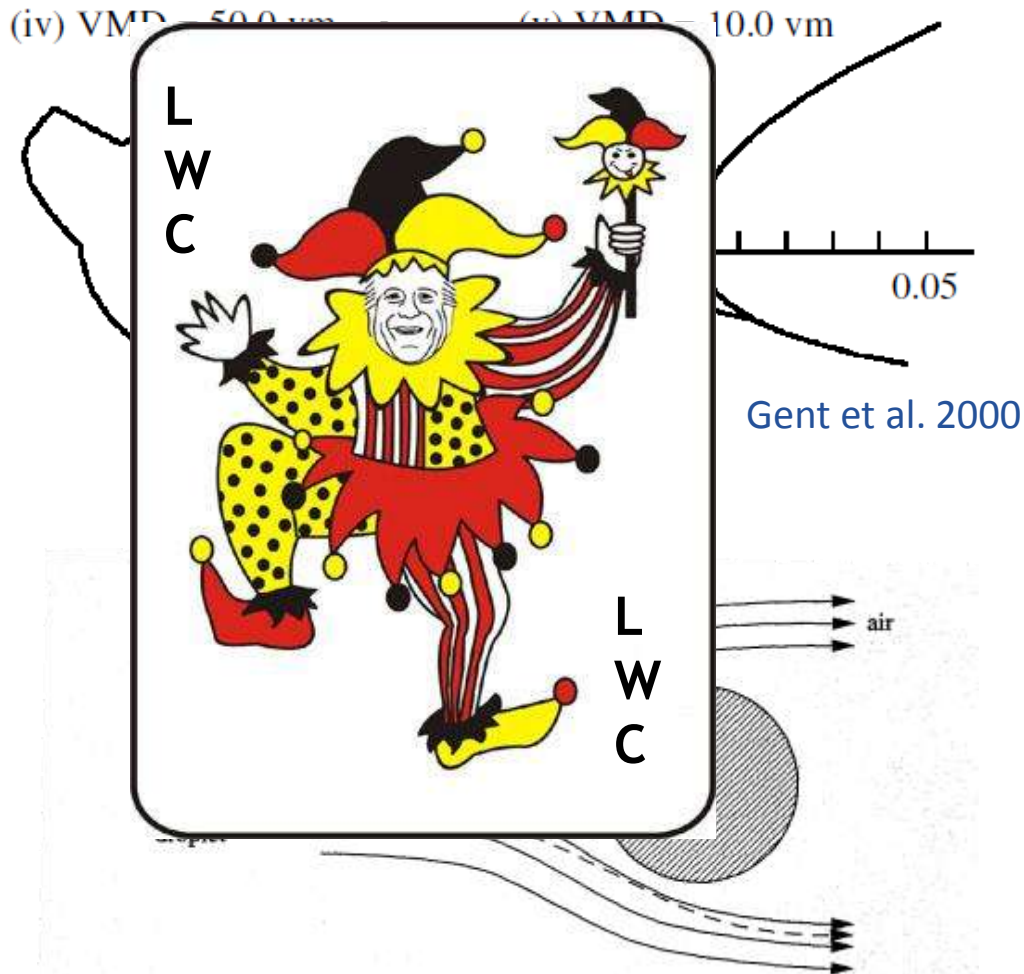

## Simple experiment

- LWC = 0.6 g/m<sup>3</sup>
- Wind = 20 m/s
- T = -15 °C
- Icing time = 60 min
- **MVD = 10  $\mu\text{m}$   $\rightarrow$  0.1 kg/m**
- **MVD = 50  $\mu\text{m}$   $\rightarrow$  1.0 kg/m**

# Motivation

## Simple experiment

- LWC = 0.6 g/m<sup>3</sup>
- Wind = 20 m/s
- T = -15 °C
- Icing time = 60 min
- MVD = 10  $\mu\text{m}$  → 0.1 kg/m
- MVD = 50  $\mu\text{m}$  → 1.0 kg/m

# Motivation

(iv) VMD = 50.0  $\mu\text{m}$

(v) VMD = 10.0  $\mu\text{m}$

min

$\rho \rightarrow 0.1 \text{ kg/m}^3$

$\rho \rightarrow 1.0 \text{ kg/m}^3$

# Motivation

- How well can LWC and MVD be predicted by a NWP model?
- How important is model resolution?
  - computationally expensive
- Does cloud microphysics scheme play any role?

# Model validation at Mt. Ylläs, N-Finland

- Mt. Ylläs: 719 m above sea level

# Model validation at Mt. Ylläs, N-Finland

Rotating multi cylinder

- Mt. Ylläs: 719 m above sea level

# Overview of the 8 cases

TABLE 1 WEATHER DATA COLLECTED FROM THE YLLÄS TEST SITE.

	Date	Time (UTC)	Wind dir	Wind speed (m s <sup>-1</sup> )	T (°C)	LWC (g m <sup>-3</sup> )	MVD (µm)
•1	08/2/1990	09	NW	6	-3	0.43	15.8
•2	14/2/1990	06	SSE	4	-5	0.27	19.9
•3	17/12/1990	12	SW	14	-4	0.25	15.3
•4	08/12/1994	08	SSE	14	-5	0.40	14.3
•5	12/12/1994	11	W	4	-6	0.09	13.7
•6	19/12/1994	11	SSW	22	-3	0.30	12.1
•7	09/1/1996	11	SW	13	-5	0.30	12.2
•8	10/1/1996	11	SW	20	-5	0.43	13.6

# Methodology

- The non-hydrostatic NWP model **WRF** (version 3.1.1 ARW) is used
- Eight cases are studied
- Horizontal grid spacing of **9 km, 3 km, 1 km** and **1/3 km**
- Vertical: 66 levels
- Initial fields and boundary data from ECMWF-ERA40
- Three **cloud microphysical schemes**
  - Two sophisticated schemes; **Thompson** scheme & **Morrison** scheme
  - A more economical typical weather prediction scheme; **EGCP01**

# Model setup

- 9 km
- 3 km
- 1 km
- 1/3 km

# Yllästunturi in the finest mesh

# LWC - Validation

- EGCP01 (Ferrier)
- Most efficient scheme

# LWC - Validation

- Thompson scheme
- 19 % more expensive

# LWC - Validation

- Morrison scheme
- 31 % more expensive

# LWC - Validation

Mean Absolute Error

•EGCP01  
•Morrison

•Thompson

MAE = 0.08 g/m<sup>3</sup>

# Prediction of MVD

Predicted

LWC

$$LWC = \frac{\pi}{6} (MVD)^3 \rho_w N_c$$

Assumed  
constant

$N_c$

Diagnosed

MVD

$N_c$  = Droplet concentration

# Prediction of MVD

$$N_c = 100 \text{ cm}^{-3}$$

$$N_c = 250 \text{ cm}^{-3}$$

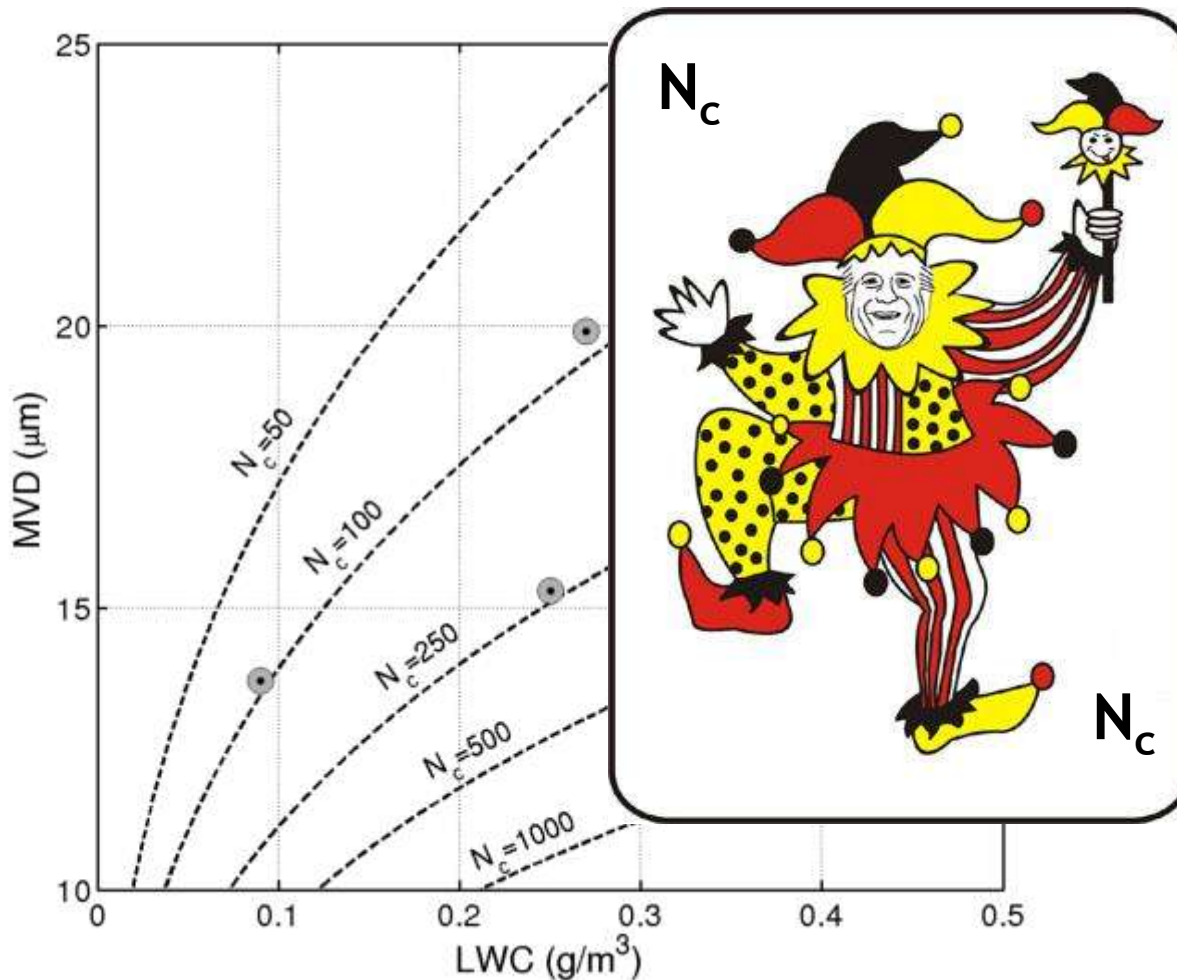

# Prediction of MVD

- $N_c$  is far from being constant
- Better than constant MVD?
- Variation in  $N_c$  is probably much less for coastal sites

# Prediction of MVD

is far from being constant  
better than constant?  
variation in  $N_c$  is probably much less for rural sites

## Conclusions

- Good prediction of LWC is possible
  - High resolution
  - Detailed microphysics
  - False alarm rate not studied
- MVD predictions not better than fixed value
- Prognostic droplet concentration in future microphysics schemes may improve icing predictions
