Blade Solutions

Work to develop repair methods for hot spots on blade heat systems

- Laboratory experiments
- Field specimen repairs
- Blade heat system repairs

Experimental setup

- 1. Initial dry fabric blade heat damage and repair
- 2. Blade heat specimens manufacturing
- 3. Thermographs
- 4. Blade heat damages (impact/lightning damage)
- 5. Thermographs
- 6. Blade heat repairs (three methods, one winter and two summer solutions)
- 7. Thermographs
- 8. Fatigue testing
- 9. Thermographs
- 10. Results
- 11. Field specimen repairs

Initial experiments, dry fibres

Damage on carbon fibre mat, Hot Spot

Initial repairs

Blade heat project

Manufacturing of 16 specimens dimension 300 x 600mm

- Heat material:
- Structural material:
- Protection material:
- Core materials:
- Resin:

Carbon fibre fabric $[\pm 45]$, (215g)Glass fibre fabric $[0, \pm 45]$, $(400g, \pm 200g)$ Glass fibre fabric $[\pm 45]$, (200g)Balsa 10mm Araldite LY1568CH/Aradur 3489BD (100/28)

> Glass fibre fabric [±45], 200 gsqm Carbon fibre fabric [±45], 215 gsqm Glass fibre fabric 2x[0, ±45],2x[400, ±200] gsqm Balsa core 10mm

inspection & repair

Recommendation to owners

Inspect, inspect and inspect!

At least one thermal inspection every year. This is by far the most important blade inspection.

Install some lightning record system, inspect after lightning

Small hotspots are repaired in hours Large hotspots takes weeks to repair, if possible!

Disconnect the blade heat system during lightning season

Thermal inspection

- Cherry picker
- Rope access
- Drone
- Long range thermal camera

Recommendation to suppliers

Blade heat system must be design to be repaired.

There are several blade heat system designs that are very hard to repair
