

AuresSound™
Acoustic
Maintenance for
Wind Farms

You Can Hear What
You Cannot See

AuresSound

AuresSound is combination of high-precision audio hardware, embedded software, network technology.

AuresSound listens the production environment, analyses the acoustic landscape and triggers alarms.

AuresSound is the most accurate method to analyse wind turbine blades and can withstand even the harshest Nordic conditions.

Acoustic Condition Monitoring

20.0 Hz	25.0 Hz	31.5 Hz	40.0 Hz
32	29	28	28
27	26	29	31
22	20	21	22
18	17	20	22
24	27	29	26
24	22	27	26
26	23	24	25
24	22	29	24

Acoustic Condition Monitoring is based on analysing sound emitted from wind turbine and online analysing the sound signal.

Different abnormalities emit different sound patterns which can be detected

Monitoring is ongoing 24/7 giving information on icing and abnormalities in all times of the day and in all conditions.

What do you detect?

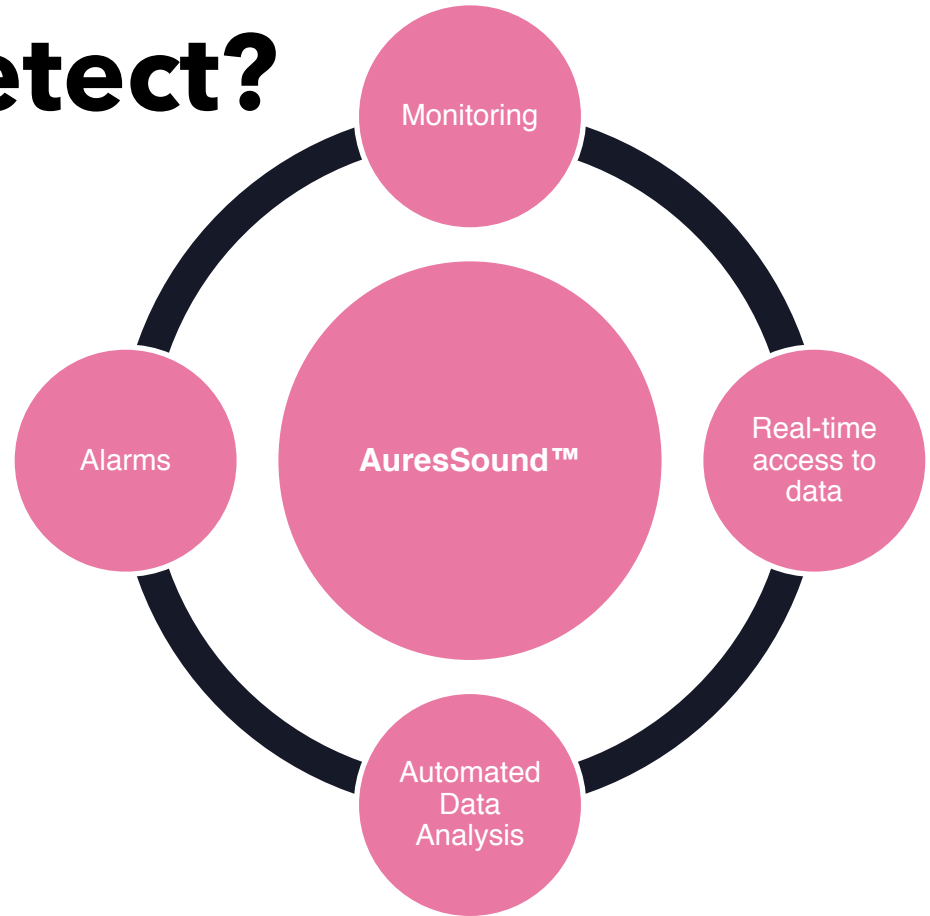

Ice build-up

Pin Holes

Cracks

Trend Analysis

Nacelle Emissions

Benefits

Better targeted maintenance actions

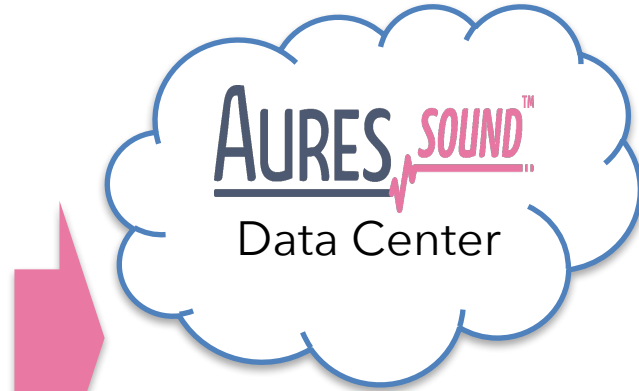

Minimise downtime

Less climbing and sky lift use.

Identification / timing of blade defect

Service concept

**Online
Data Fusion
and analysis**
