

Importance sampling for ice throw in QBlade

Matthew Lennie

Sean Dominin

David Marten

George Pechlivanoglou

Prof. O Paschereit

Why run simulations?

Ice Fall and Throw presents risk to:

- People
- Commercial and Residential Structures

We need to prove it is unlikely to:

- Local community
- Building Owners
- Insurers
- Media?
-

Ice Throw

SIMULATION APPROACH

- Draw a big circle based on rotor size with very large safety margin

Estimated Outcomes: No simulation, very large offset required, projects in jeopardy.

- Complex metrology to predict icing
- Complex physics for ice release
- Full unsteady CFD of a tumbling ice chunk.

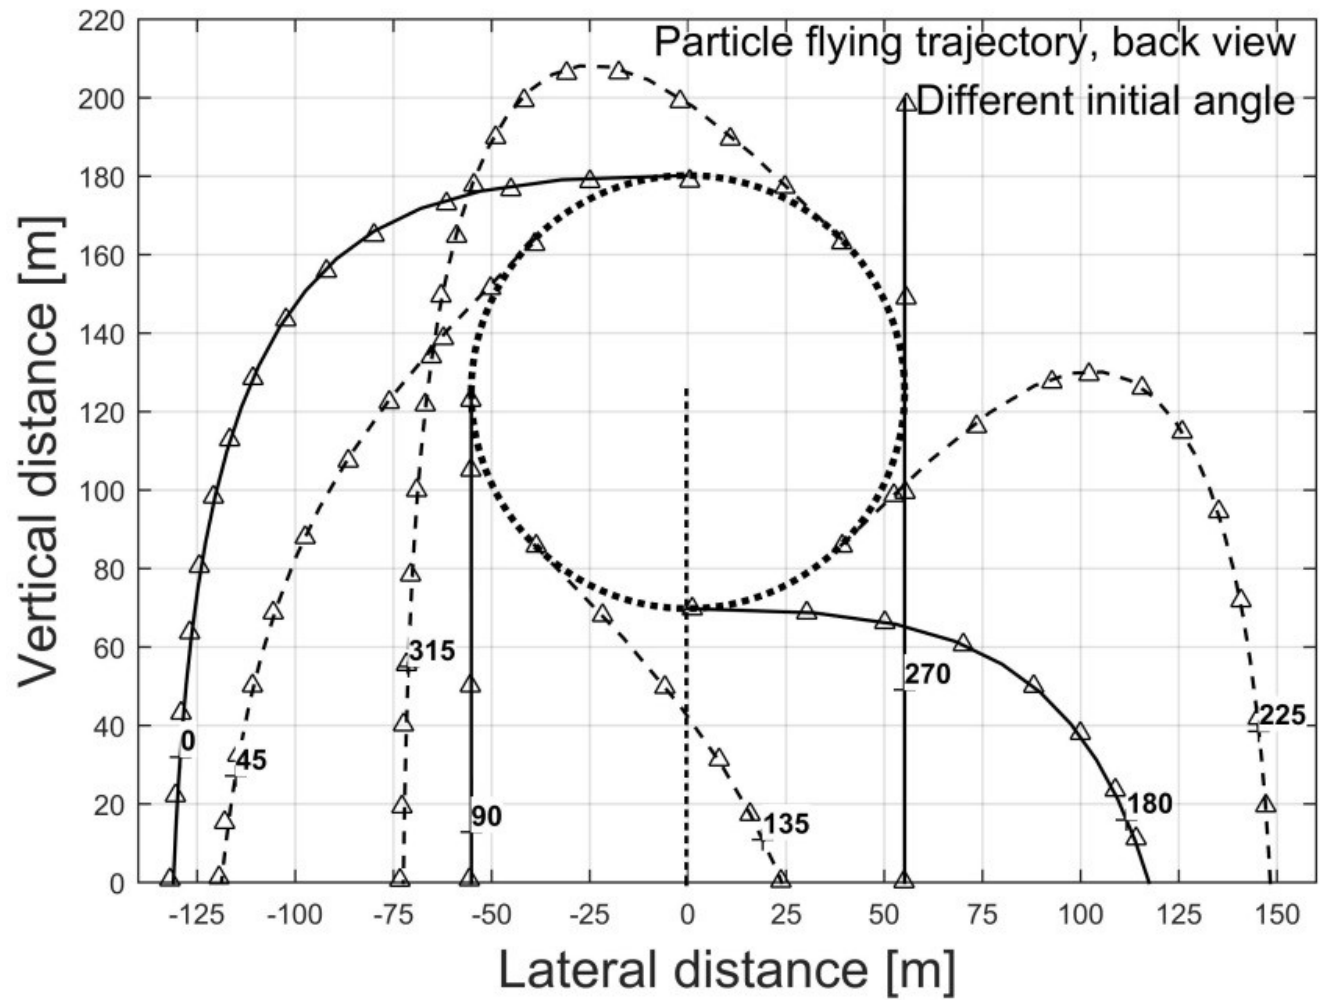

Estimated Outcomes: 3 research grants, 4 PhD, 20000 hours of simulation time, a Nobel prize in physics and no meaningful result

- Treat ice chunks as a particle with simple properties
- Randomly select ice particles
- Use simple metrological properties
 - Wind Rose
 - Number of Ice days predicted.

Estimated Outcomes: Risk at each location around the turbine (1/2 day work)

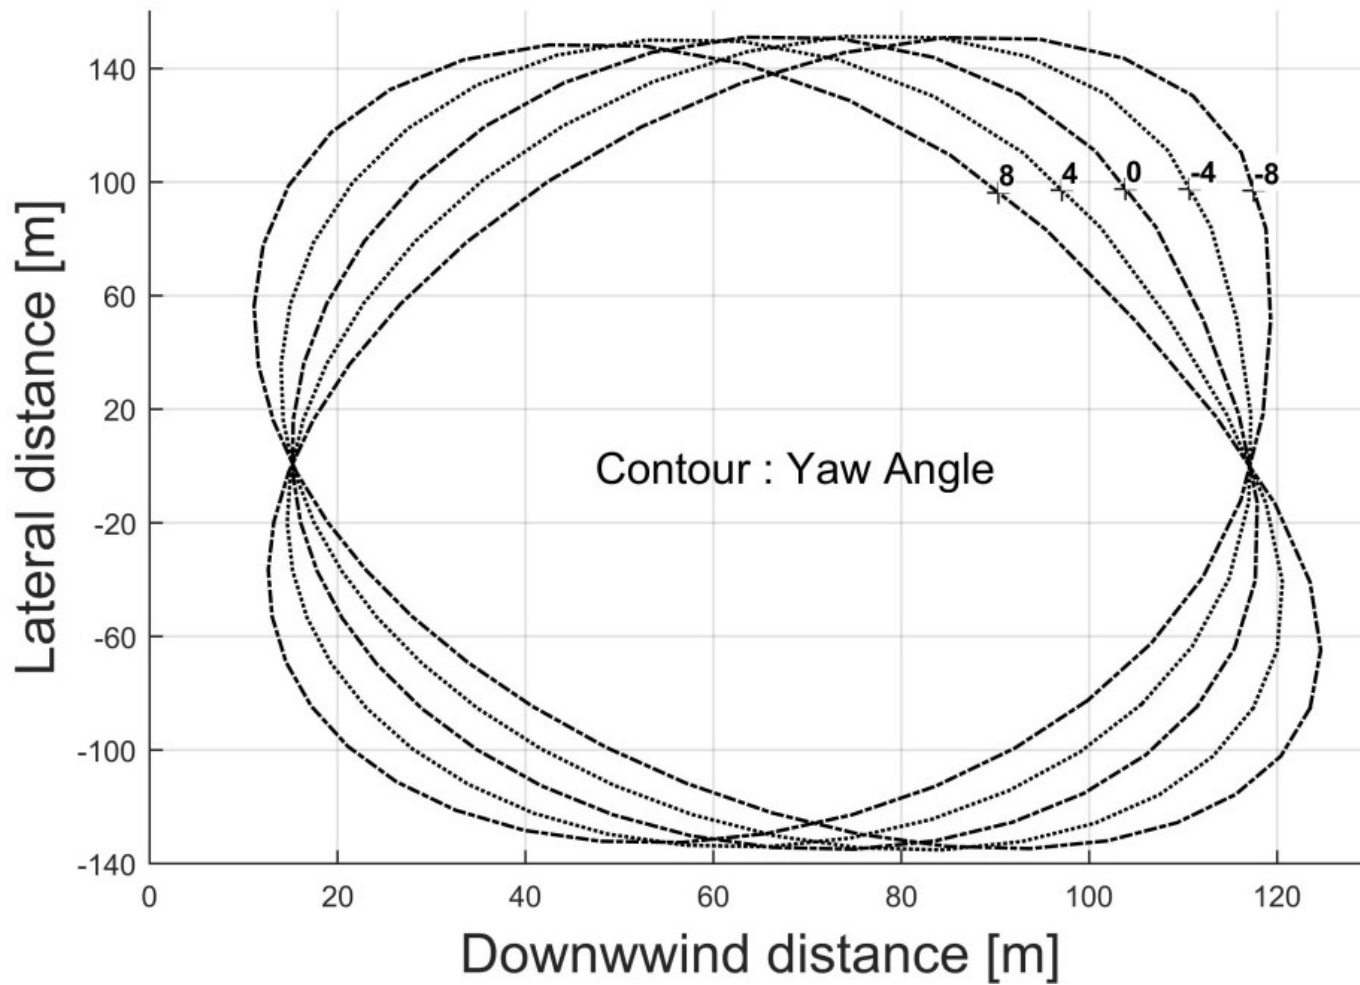

Ice Throw

WHICH VARIABLES MATTER?

Which variables matter?

Which variables matter?

Video2 : NREL 5MW Reference

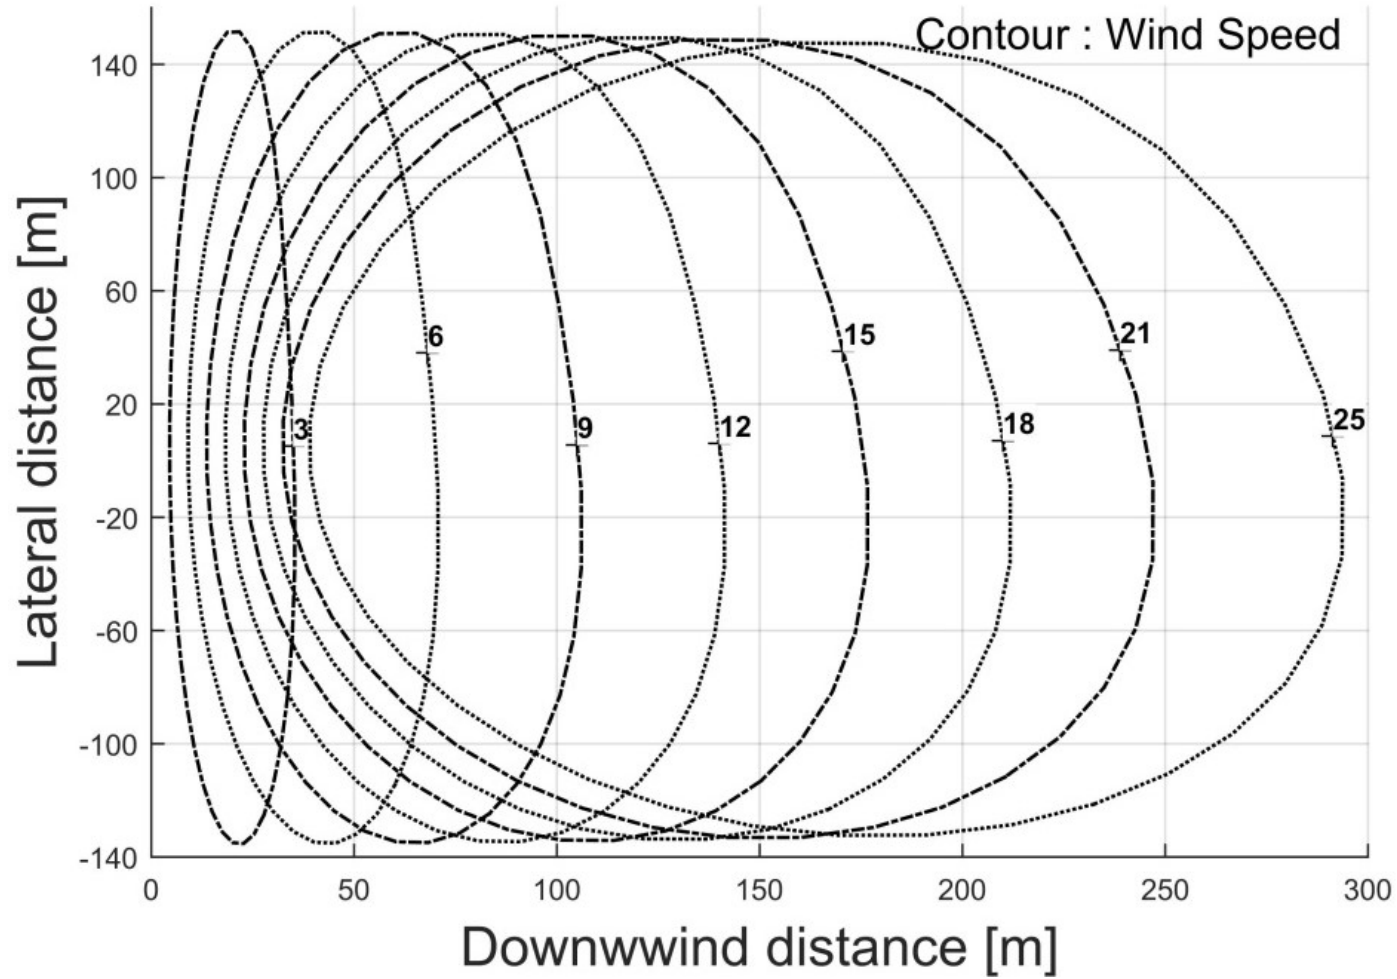

www.fraps.com

Time: 429.53 s
Power: 0 kW
Cp: 0
V_in @ hub: 4.296 m/s

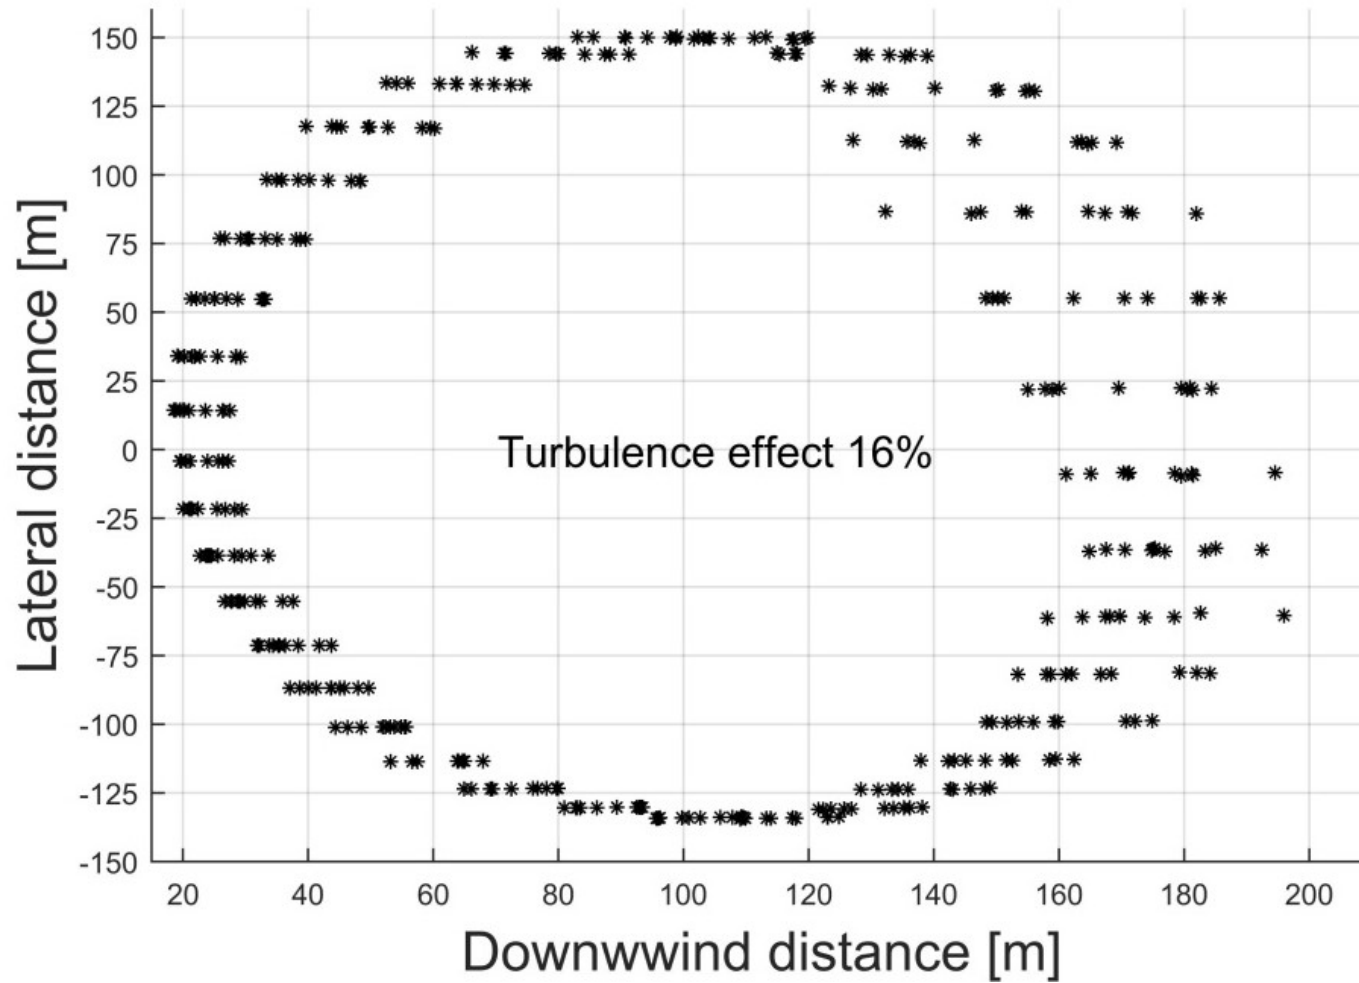

Vortex Elements: 0

Ice Throw

WHAT DATA EXISTS?

How much do we know?

Drag coefficient	✓
Ice fragment mass	✓
Initial radial position	✗
Azimuth position	✗
Rotor speed	✓
Wind speed	✓
Wind direction	✓
Yaw angle	✓
Wake	✓
