

Verification of Icing-model, in Finland.

IWAIS 2015, Uppsala, Sweden
Karoliina Hämäläinen

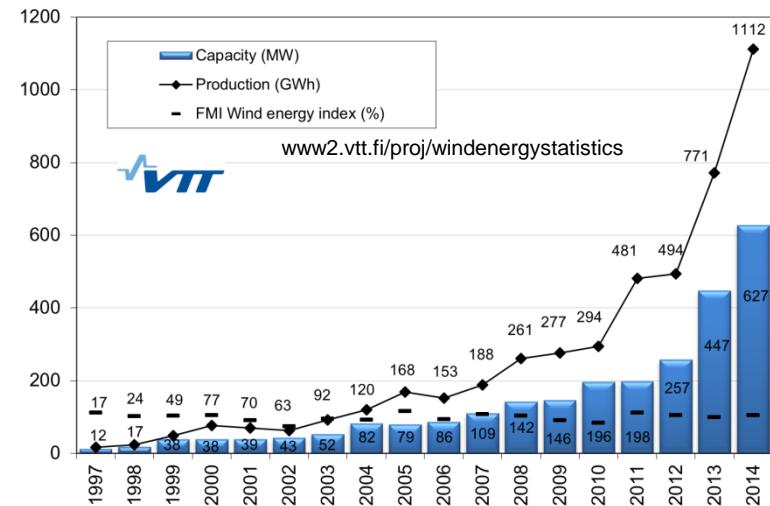

Content

- Motivation and background
- Icing-model
- Observation comparison
- Sensitivity tests
- Conclusions

Motivation and background

- Governments new energy strategy and goal for wind energy:
 - 6TWh (2000MW), year 2020
 - 9TWh (3750MW), year 2025
- After publishing Wind Atlas the installed capacity of wind power has grown fast.
- Where to invest?
 - Best wind conditions?
 - Is there wind during winter?

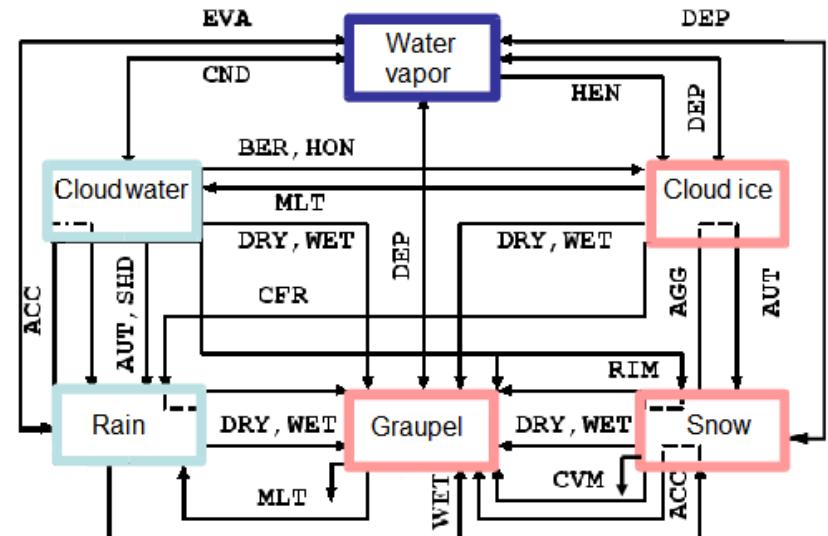

Icing Atlas : Icing-model

➤ Physic based on Standard ISO12494

➤ Icing rate [g/h]:

$$\frac{dm}{dt} = \alpha_1 \alpha_2 \alpha_3 \cdot w \cdot A \cdot V$$

- α_1 = collision efficiency
- α_2 = sticking efficiency
- α_3 = accretion efficiency
- w = mass concentration of particles
- A = Surface area of freely rotating cylinder
- V = Wind speed

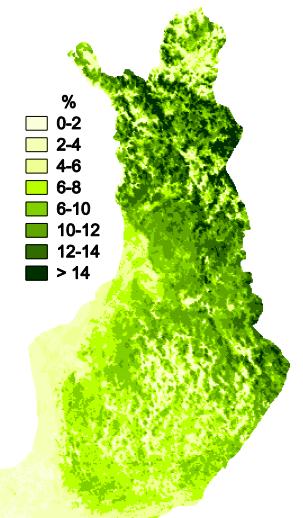

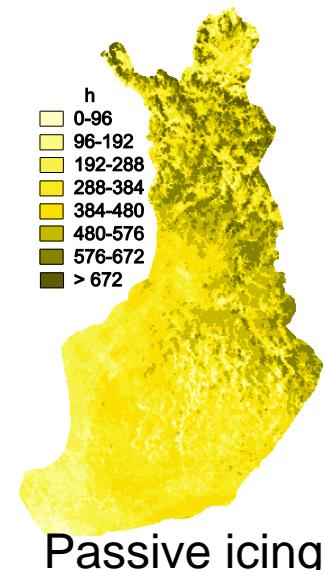

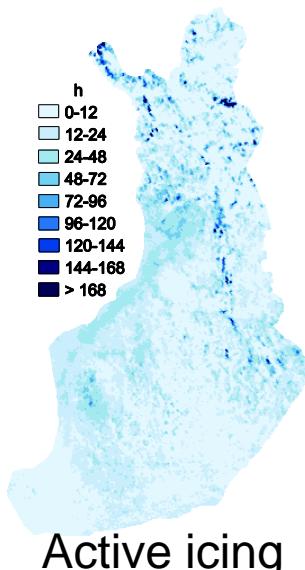

Microphysical Scheme diagram

1st AROME training course, Poiana-Brasov, Romania, 21-25 November 2005

Icing Atlas

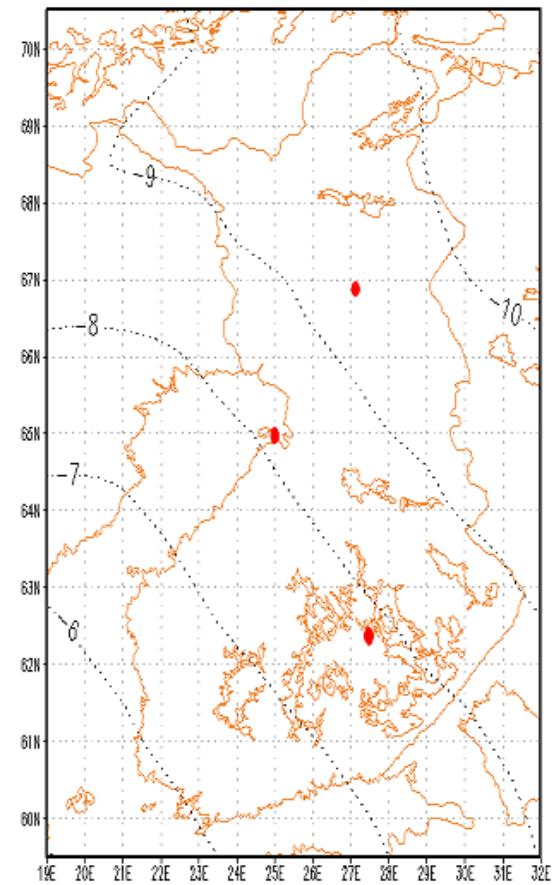

- Hours per month/annual.
- Active icing, passive icing and power production loss.
- Heights: 50m, 100m, 200m
- www.windatlas.fi/en

Power production loss

Observations

- Puijo, Eastern-Finland
 - Labkotec, LID-3300IP icing detector, raw data
 - Vaisala, FD12P visibility censor, On-Off
- Luosto, Lapland
 - Rosemount, icing detector, On-Off
 - Combitec, ice monitor, ice mass
- Riutunkari, West coast
 - Labkotec, LID-3300IP icing detector, On-Off

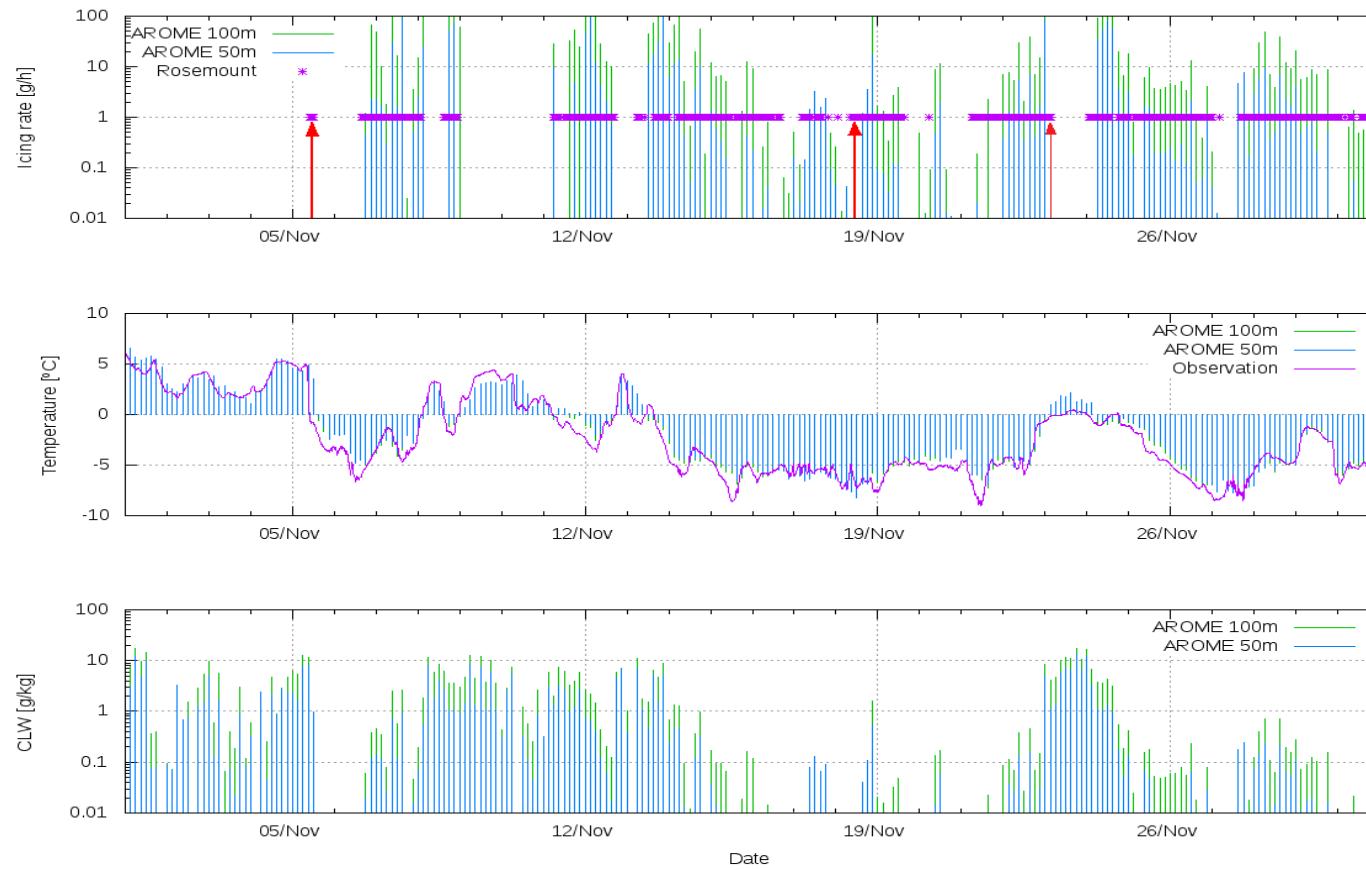

Challenges with observations

- Limited amount of measurement data.
 - Not part of FMI's daily routine.
- Data quality.
 - Video control at Puijo and Luosto stations.
- Representativeness.
 - Luosto fjell can not be seen by the NWP-model with horizontal resolution 2,5km.
- Model levels.
 - The lowest model level at 20m.

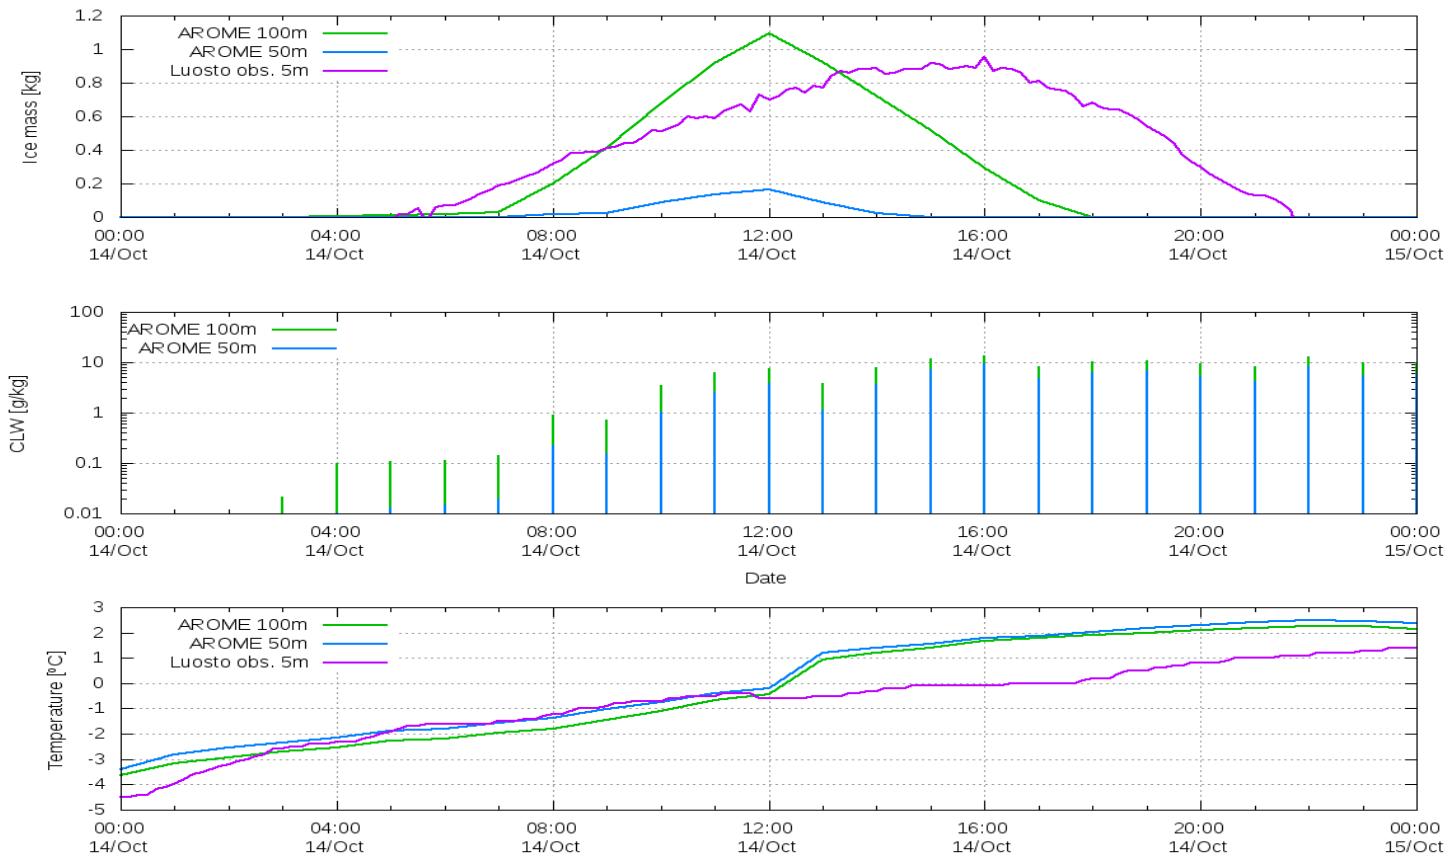

Observation comparison

- Luosto observations compared to Icing-model results, during November 2005.

Ice mass comparison

- Luosto observations compared to ice mass measurements, during October 14th to the 15th in 2007.

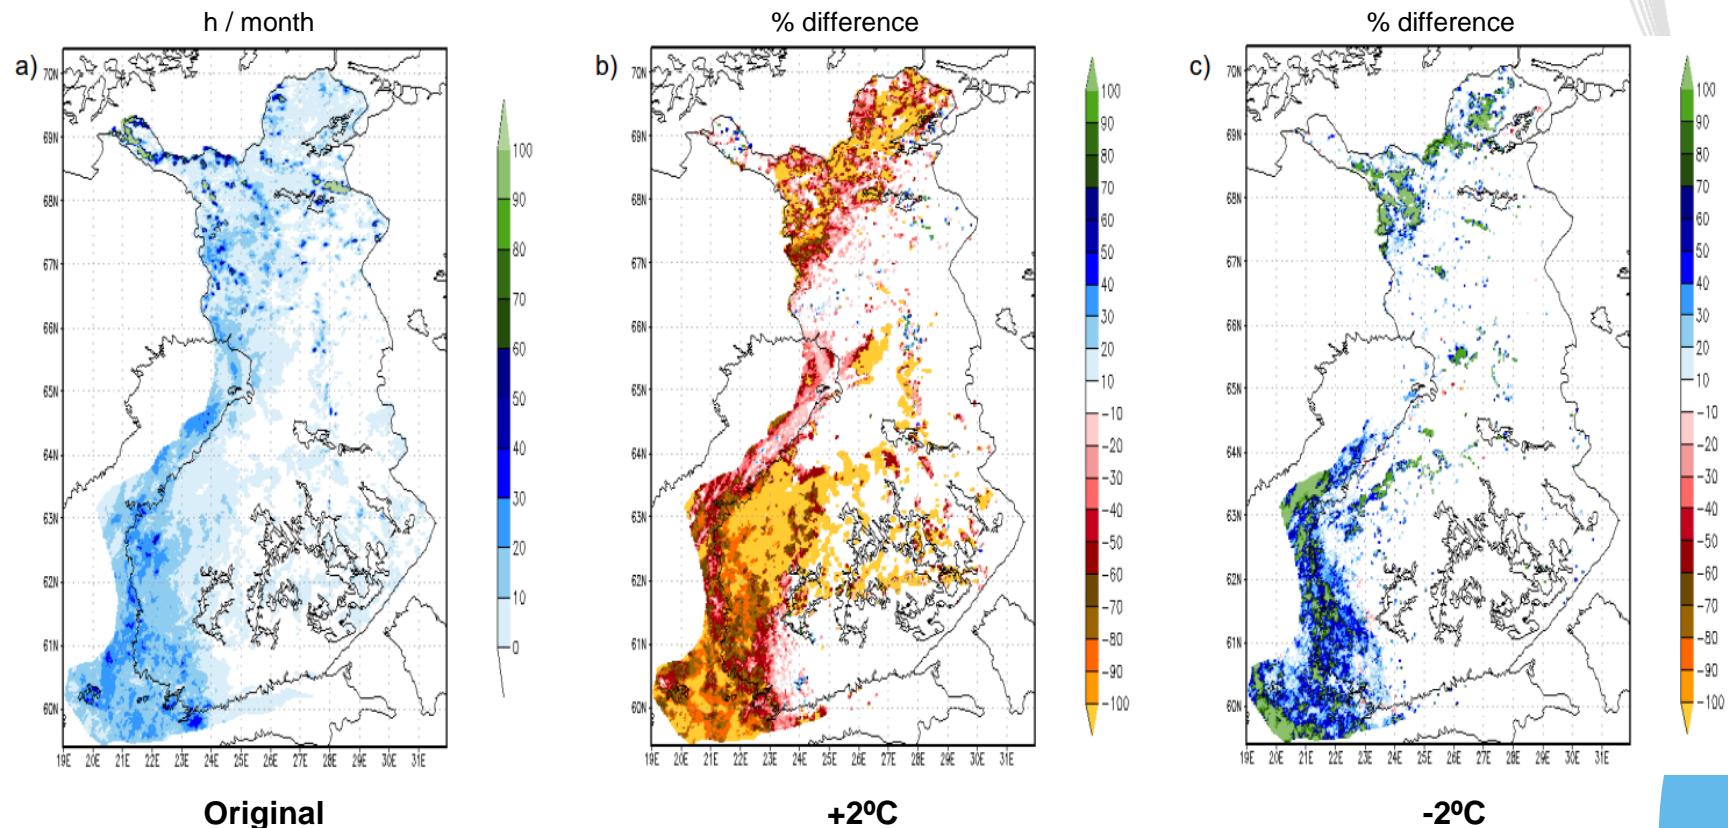

Sensitivity tests

- How sensitive is the Icing-model to the input?
- Difference in monthly averages?
- Perturbations that were made:
 - Temperature → $\pm 2^{\circ}\text{C}$
 - Wind speed → $\pm 2\text{m/s}$
 - Liquid water content → $\pm 20\%$
 - Droplet number concentration → $\pm 30\%$
- Temperature and Wind speed are being measured and verified.
- LWC and DNC are not measured.

Sensitivity tests

- Effects of perturbed temperature on hours of active icing, during February 2006.

Conclusions

- According to sensitivity tests the temperature, wind and liquid water content are the dominant variables.
- Droplet number concentration does not seem to cause significant errors if the liquid water content is "constant".
- Observation comparison show that the results are strongly dependent on temperature and liquid water content.
- Icing-model has the skill to detect icing events.
 - No skill to predict ice mass accumulation.
