Summary

- TechnoCentre's infrastructure location
- Meteorological mast location
- Undisturbed wind sectors
- Research objectives
- Met mast configuration
- Future works

TechnoCentre's infrastructure location

SNEEC R&D wind farm

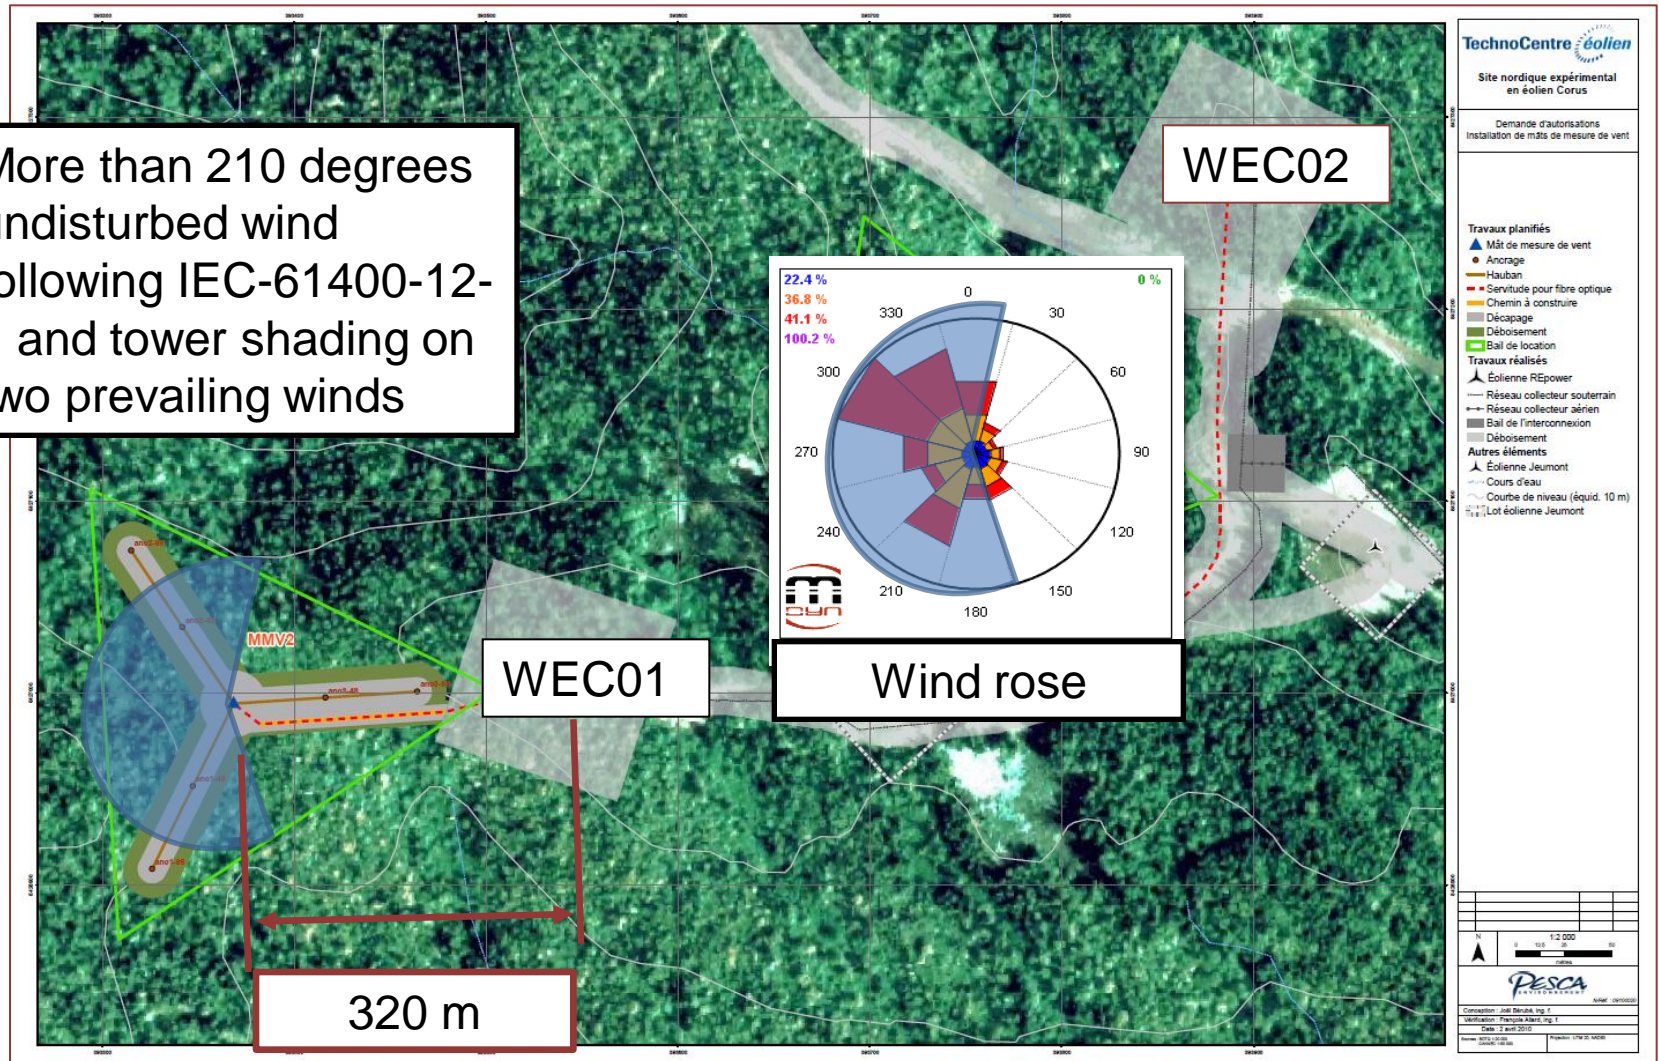

Meteorological mast location

Undisturbed wind sectors

More than 210 degrees undisturbed wind following IEC-61400-12-1 and tower shading on two prevailing winds

Research objectives

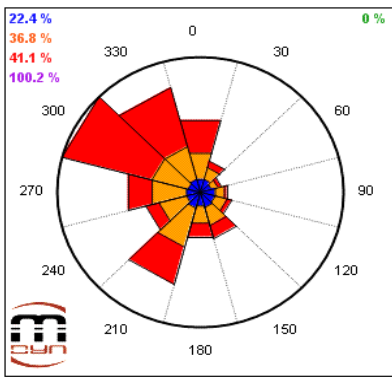

- Analyze power performance of 2 Repower MM92 CCV in cold climate conditions and complex terrain
- Relate the atmospheric boundary layer in relation to icing conditions
- Evaluate wind energy losses due to the cold climate conditions
- Test and compare sensors for cold climate and complex terrain utility
- Compare remote sensing technologies in cold climate (SODAR, LIDAR and met mast)
- Validate numerical flow model in complex terrain
- Analyze the atmospheric boundary layer (IT, shear, thermal stratification)

Infrastructure

Compliance with CSA-S37-01
(can resist to a combined load
of 40 mm of ice and 57 m/s)

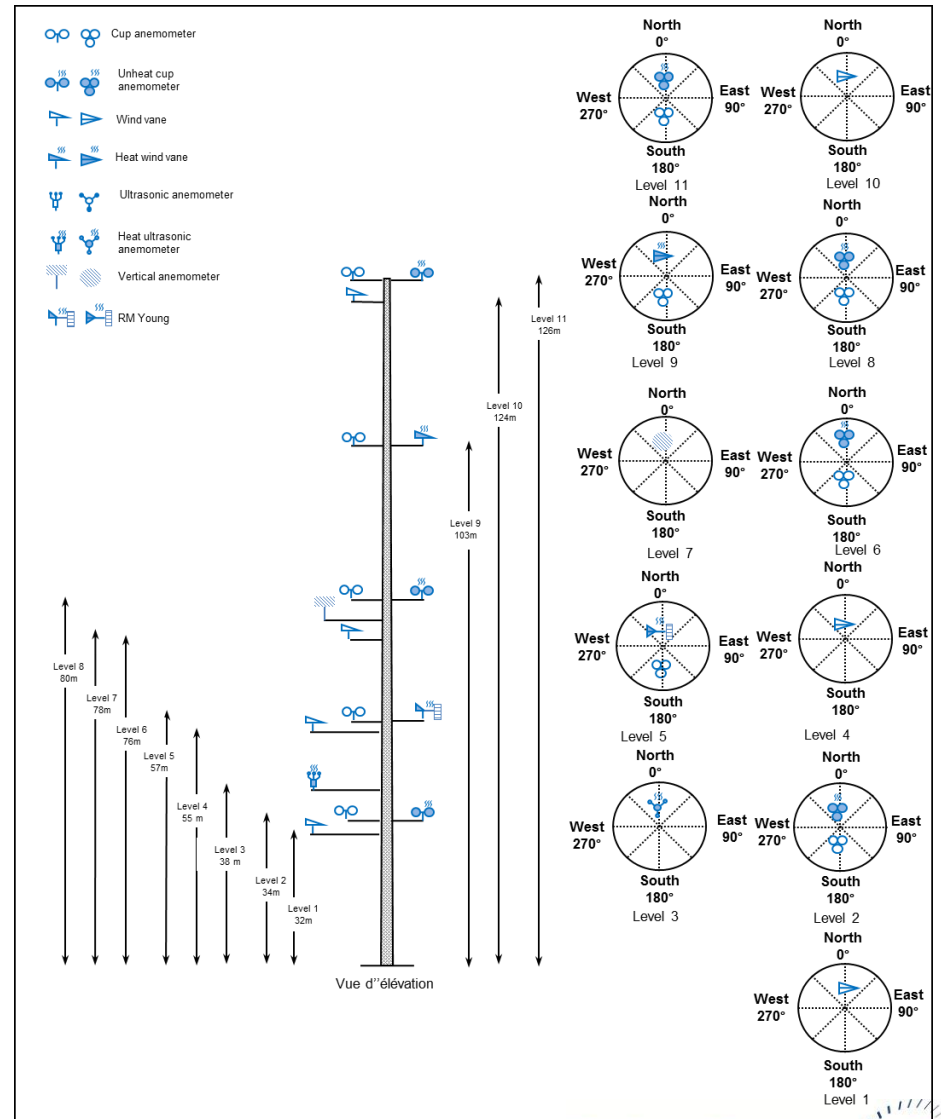

It's now installing
booms

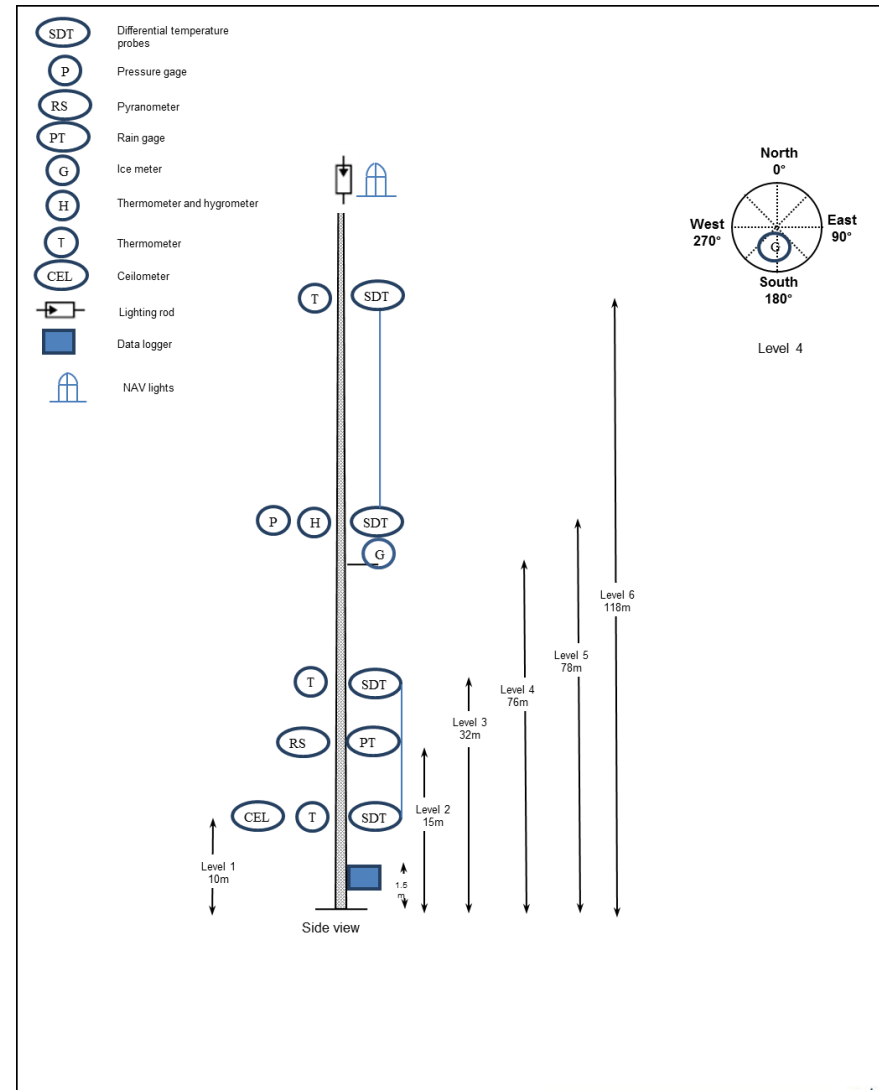

Met mast configuration

- 3 levels with heat and unheat anemometer
- 2 levels to compare heat and unheat wind directions
- 5 levels with unheat cup anemometers class I
- Metek 3D heat anemometer
- One vertical propeller anemometer
- *Design to be fully expandable (adding some sensors after installation)*

Met mast configuration

- Ceilometer to detect cloud height
- 4 thermometers and 2 standard differential temperature probes to detect the thermal stability
- Pyranometer
- Optical ice meter
- Rain gage to detect precipitation
- Hygrometer
- *All data were send to Osisoft PI archive system with 1Hz frequency*
- *A CQ with more than 30 criteria was done on each data*

Met mast configuration

- All meteorological sensors are installed on 4 m long booms

Future works

- Test of prototype heat anemometer from ULaval
- Verify correlation between energy losses within cold climate condition on the met mast comparing to Repower MM92CCV (especially on stability - dT/dz)
- Establish standard and guidelines for cold climate wind energy production
- Forecast icing type and accretion from the meteorological conditions
- Install cameras points sensors
